You might want a link to have a special action when double-clicked which prevents the default action of the link (go to another page). So:

Double-click: does something special, does not do normal click event at all

Click: works as normal

You'll need to have a very slight delay on firing off the normal click action, which you cancel when the double click event happens.

jQuery

```
function doClickAction() {
  $("#click h2").append("•");
}
function doDoubleClickAction() {
```

```
        $("#double-click h2").append("•");

    }

    var timer = 0;

    var delay = 200;

    var prevent = false;

    $("#target")
      .on("click", function() {
        timer = setTimeout(function() {
          if (!prevent) {
            doClickAction();
          }
          prevent = false;
        }, delay);
      })
      .on("dblclick", function() {
        clearTimeout(timer);
        prevent = true;
        doDoubleClickAction();
      });
```
